RHEINZINK

A different interpretation of having an office and home under the same roof. The twins among buildings can be found in Grevenmacher, Luxembourg. The architect wanted to combine a workspace and home while still creating a clear division between the two types of spaces. Although the duplex shares many characteristics, the differently designed facades distinguish each half of the house. Large glass fronts significantly shape the building's architecture.
RHEINZINK titanium zinc, installed with the angled standing seam technique, was selected as the material. The surface quality RHEINZINK-prePATINA blue grey was used for the residential section while prePATINA graphite grey was chosen for the office spaces. You can find additional information in a project report that can be downloaded on the left.
